

Online Examination System – Project Proposal :

Intended Use of the System:

The system is mainly intended to be used by [students](#), [instructors](#), and [admin](#), with each type of user having a different role.

[Students](#) will use the system to access their assigned exams and take them online. During an exam, students will be able to navigate between questions, view the remaining time through a countdown timer, answer the questions, and submit their exams. After grading, students will be able to access their results through their dashboard.

[Instructors](#) will use the system to create and manage exams. They will be able to select questions from the available question bank and use them to assemble exams. Instructors will also be able to add new questions and modify existing questions when necessary. They can configure exam settings such as duration and question randomization. After students complete an exam, instructors can view their results and performance analytics.

[Admin](#) will be responsible for managing the system and maintaining the question bank. Instructors can provide question sets to the admin, who adds and organizes them within the system according to courses and topics. Admins will also oversee system operations, including the management of student results, the automatic grading process, and the available analytics.

Overall Functionality:

The system will provide a reusable [question bank](#) containing different types of questions, including multiple-choice, true/false, and short-answer questions. Question sets provided by instructors can be added to the system by the admin and organized according to courses and topics. Instructors can then access the question bank when creating their exams and can add or modify questions when necessary.

The system will allow instructors to [create and configure timed exams](#) using questions from the question bank. Instructors can select the questions they want to include, set the exam duration, and enable question randomization when needed. This allows instructors to prepare exams more efficiently while reusing available questions.

When students take an exam, they will use a dedicated [exam interface](#) that provides question navigation and a countdown timer. The system will manage the exam state and allow students to submit their answers within the specified time.

After submission, the [automatic grading](#) functionality will evaluate objective questions and calculate the students' scores automatically. The admin will oversee the grading and results management, while instructors and students will be able to access the relevant results. This reduces the instructors' workload and allows students to receive their results more quickly.

Finally, the system will provide [dashboards and analytics](#) for viewing student and question performance. These features will help instructors identify students' strengths and weaknesses and evaluate individual question performance. Admins will also be able to monitor relevant system data and results.
